Report of Investigation

Reference Material 8542

IAEA—CH-6 Sucrose (Carbon Isotopes in Sucrose)

This Reference Material (RM) is intended to provide a sample with a known isotope-amount ratio of carbon (C) in organic materials. The equivalent name for this RM, as used by the International Atomic Energy Agency (IAEA) and the U.S. Geological Survey (USGS), is IAEA-CH-6 and is listed in column 2 of Table 1. This material was also formerly named ANU Sucrose. A unit of RM 8542 consists of one bottle containing approximately 1 g of sucrose.

Table 1. Reference Value and Expanded Uncertainty for the Relative C Isotope-Amount Ratio of RM 8542

RM Number	Name	$\delta^{13}\text{C}_{\text{VPDB}}^{(a,b)} \times 10^3$
RM 8542	IAEA-CH-6	$-10.45 \pm 0.07 \text{ ‰}$

- (a) The $\delta^{13}\text{C}$ values are expressed as a mean \pm an expanded uncertainty. The expanded uncertainty is equal to $U = ku_c$, where u_c is the combined standard uncertainty as defined by the ISO and NIST Guide [1] and k is the coverage factor. The value of the consensus mean and the associated combined standard uncertainty were calculated using a multivariate Bayesian approach [2]. The combined standard uncertainty is intended to represent, at the level of one standard deviation, the combined effects of Type A and B uncertainties on the reference value. Uncertainty in the bias of the methods is not included. The coverage factor k is 2 and provides an expanded uncertainty interval that has about a 95 % probability of encompassing the consensus mean.
- (b) Normalized to $\delta^{13}\text{C}_{\text{VPDB}}$ of RM 8545 (L-SVEC) = -46.6 ‰ .

Expiration of Value Assignment: RM 8542 is valid, within the measurement uncertainty specified, until **31 December 2020**, provided the RM is handled in accordance with instructions given in this Report of Investigation (see “Instructions for Use”). The reference value is nullified if the RM is damaged, contaminated, or otherwise modified.

Maintenance of RM: NIST will monitor this RM over the period of its validity. If substantive technical changes occur that affect the value assignment before the expiration of this report, NIST will notify the purchaser. Registration (see attached sheet) will facilitate notification.

The technical aspects involved in the issuance of this RM were coordinated through the NIST Analytical Chemistry Division by R.D. Vocke, Jr.

Reference Difference in Isotope-Amount Ratio Values: The differences in measured isotope-amount ratios of stable carbon isotopes $[n(^{13}\text{C})/n(^{12}\text{C})]$ are reported as $\delta^{13}\text{C}$ values, where $\delta^{13}\text{C} = ([n_{\text{sample}}(^{13}\text{C})/n_{\text{sample}}(^{12}\text{C})] - [n_{\text{VPDB}}(^{13}\text{C})/n_{\text{VPDB}}(^{12}\text{C})]) / [n_{\text{VPDB}}(^{13}\text{C})/n_{\text{VPDB}}(^{12}\text{C})]$. VPDB refers to the Vienna PDB scale, which is determined by assigning a $\delta^{13}\text{C}$ value of $+1.95 \text{ ‰}$ to RM 8544 (NBS 19) [3]. The reported $\delta^{13}\text{C}$ result for RM 8542 has been normalized to yield a consensus value of -46.6 ‰ for RM 8545.

Robert L. Watters, Jr., Chief
Measurement Services Division

The reference value for $\delta^{13}\text{C}$ listed in Table 1 together with its expanded uncertainty are based on continuous flow elemental-analyzer isotope-ratio mass spectrometry [4] using the general method of Qi *et al.* [5]. Four expert laboratories (Centrum voor Isotopen Onderzoek, Rijksuniversiteit Groningen, Groningen, Netherlands; Max-Planck-Institute for Biogeochemistry, Jena, Germany; UFZ (Umweltforschungszentrum) Leipzig-Halle GmbH, Leipzig, Germany; U.S. Geological Survey, Reston, Va., USA) performed the analytical measurements and their results and the multivariate Bayesian approach for data reduction are described in detail in [2]. A reference value is a non-certified value that is the best estimate of the true value; however, the value may reflect only the measurement precision and may not include all sources of uncertainty.

Support aspects involved in the issuance of this RM were coordinated through the NIST Measurement Services Division.

INSTRUCTIONS FOR USE

Distribution: The distribution of RM 8542 (IAEA-CH-6) is limited to one unit per three-year period of time.

Storage and Stability: Sucrose is stable at normal room temperatures. This RM should be stored in the container in which it is supplied to the user.
