Certificate of Analysis

Standard Reference Material[®] 2294

Reformulated Gasoline (11 % MTBE)

This Standard Reference Material (SRM) is intended primarily for use in the calibration of instruments and the evaluation of methods used for the determination of total sulfur, benzene, toluene, and methyl tert-butyl ether (MTBE) in reformulated gasoline or similar matrices. A unit of SRM 2294 consists of a set of two 20 mL ampoules containing a synthetic gasoline blend of 25 organic compounds.

Certified Mass Fraction Values: Certified mass fraction values and associated 95 % confidence intervals are given in Table 1. A NIST certified value is a value for which NIST has the highest confidence in its accuracy in that all known or suspected sources of bias have been investigated or taken into account [1].

Reference Mass Fraction Values: Reference mass fraction values and associated 95 % confidence intervals are given in Table 2. A NIST reference value is a noncertified value that is an estimate of the true value. However, the value does not meet the NIST criteria for certification and is provided with an associated uncertainty that may reflect only measurement precision, may not include all sources of uncertainty, or may reflect a lack of sufficient statistical agreement among multiple analytical methods [1].

Expiration of Certification: The certification of **SRM 2294** is valid, within the measurement uncertainty specified, until **31 December 2022** provided that the SRM is handled and stored in accordance with the instructions given in this certificate (see "Instructions for Storage and Use"). However, the certification is nullified if the SRM is damaged, contaminated, or otherwise modified.

Maintenance of SRM Certification: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification before the expiration of this certificate, NIST will notify the purchaser. Registration (see attached sheet) will facilitate notification.

The overall direction and coordination of technical measurements leading to certification were performed by G.W. Kramer and F.R. Guenther of the NIST Analytical Chemistry Division.

Analytical measurements leading to the certification of this SRM were performed by S.N. Chesler, S.J. Choquette, F.R. Guenther, T.L. Green, W.R. Kelly, J.L. Mann, S.A. Margolis, L.C. Sander, and R.D. Vocke, Jr. of the NIST Analytical Chemistry Division. Data analysis was performed by D.L. Duewer of the NIST Analytical Chemistry Division.

Support aspects involved in the issuance of this SRM were coordinated through the NIST Measurement Services Division.

NOTICE AND WARNING TO USERS

Consult the Material Safety Data Sheet for details on safe handling before use. Ensure local exhaust or adequate ventilation in storage and laboratory facilities meet published gasoline exposure limits. Prevent contact with heat, sparks, or open flame. Those handling gasoline should wear appropriate clothing and gloves to prevent skin contact with this material and appropriate safety goggles to prevent eye contact.

Protect ampoules from physical damage. The unscored, thick-walled ampoules of this SRM must be opened with care and attention. Score the ampoule completely around the neck with a sharp triangular file or other scoring tool. Wrap the body of the ampoule in a thick cotton towel or use leather gloves while snapping the neck from the body of the ampoule.

INSTRUCTIONS FOR STORAGE AND USE

Storage: Sealed ampoules, as received, should be stored in the dark at temperatures between 10 °C to 30 °C away from incompatible materials. (See “Notice and Warning to Users”) Ampoules should be opened as described above.

Use: Aliquots for analysis (minimum sample size of 1 g) should be withdrawn at 20 °C to 25 °C and used immediately after opening the ampoules. Samples must be processed without delay for the certified values to be valid within the stated confidence intervals.

SOURCE AND PREPARATION

All chemicals used in the preparation of this material were obtained from commercial sources. The synthetic gasoline base was prepared from 21 reagent-grade saturate, olefinic, and aromatic stock materials. A typical gas chromatogram of the reformulated gasoline base is shown in Figure 1. Three reagent-grade thionate stock materials were mixed with HPLC-grade MTBE. Known masses of synthetic gasoline base, thionate/MTBE mixture, and MTBE were combined, mixed, and chilled in a pressurized vessel. The solution was dispensed into 20 mL glass ampoules; the ampoules were cooled to to 30 °C and flame sealed.

Homogeneity Assessment: The homogeneity of SRM 2294 was assessed at NIST at a 1 g sample size.

Value Assignment: The mass fraction of sulfur is based on isotope-dilution thermal ionization mass spectrometry (ID-TIMS) [2]. The mass fraction of benzene and the mass fraction of ethanol are based upon split-injection, flame-ionization detection gas chromatographic (GC-FID) analysis and gravimetry. The mass fraction of toluene is based upon reversed-phase liquid chromatography, GC-FID analysis, and gravimetry. The reference value of water is based on coulometric Karl Fischer titration. The major aromatic and olefinic constituents of the synthetic base gasoline were determined using GC-FID after a rigorous evaluation of the purity of the constituent stock materials by gas chromatography-mass spectrometry (GC/MS). The reference values of the organic components of this SRM have been calculated from results of the GC-FID measurements of the base gasoline composition combined with the known masses of the various components of the mixture. The aromatic, olefinic, and saturate composite reference values are the sum of all constituents identified as belonging to each of these groupings.

The reference value of total organic oxygen composite is the sum of the oxygen mass fraction of all identified organic oxygenates. The 95 % confidence interval for each certified and reference value has been assigned on the basis of analytical judgment [3,4]. It incorporates estimates of analytical precision, known biases among methods of differing analytical reliability, reliability estimates for the mass-spectrometric identification of impurities, and allowance for apparent heterogeneity among the ampoules. The certified mass fraction of each component is expected to lie within the specified interval with a 95 % level of confidence.

Table 1. Certified Mass Fraction Values for Selected Constituents of SRM 2294

Constituent	CAS Registry Number	Mass Fraction (g/g)	95 % Analytical Confidence Interval (g/g)
Total sulfur		40.9×10^{-6}	$(39.9 \text{ to } 41.9) \times 10^{-6}$
Benzene	71-43-2	1.03×10^{-2}	$(1.02 \text{ to } 1.05) \times 10^{-2}$
Toluene	108-88-3	8.29×10^{-2}	$(8.13 \text{ to } 8.37) \times 10^{-2}$
MTBE	1634-04-4	10.97×10^{-2}	$(10.51 \text{ to } 11.11) \times 10^{-2}$

Table 2. Reference Mass Fraction Values for Selected Constituents of SRM 2294

Constituent	CAS Registry Number	Mass Fraction ($\times 10^{-2}$) (g/g)	95 % Analytical Confidence Interval ($\times 10^{-2}$) (g/g)		
1,2,4,5-Tetramethylbenzene	95-93-2	1.01	0.99	to	1.06
Naphthalene	91-20-3	1.20	1.18	to	1.22
Ethylbenzene	100-41-4	2.05	2.03	to	2.07
<i>o</i> -Xylene	95-47-6	2.07	2.04	to	2.09
1,3,5-Trimethylbenzene	108-67-8	2.07	2.04	to	2.11
1,2,4-Trimethylbenzene	95-63-6	2.10	2.07	to	2.14
<i>m</i> -Xylene and <i>p</i> -xylene	108-38-3	6.14	6.12	to	6.18
	106-42-3				
Total identified aromatics		26.06	25.95	to	26.24
1-Pentene	109-67-1	0.77	0.75	to	0.80
2,3-Dimethyl-2-butene	563-79-1	1.66	1.63	to	1.68
1-Heptene	592-76-7	1.67	1.65	to	1.70
Total identified olefins		4.26	4.23	to	4.29
<i>n</i> -Pentane	109-66-0	3.73	3.72	to	3.74
<i>n</i> -Hexane	110-54-3	3.87	3.86	to	3.88
<i>n</i> -Decane	124-18-5	4.33	4.32	to	4.34
<i>n</i> -Heptane	142-82-5	8.13	8.12	to	8.14
2,4-Dimethylpentane	108-08-7	8.26	8.25	to	8.27
<i>n</i> -Octane	111-65-9	8.35	8.34	to	8.36
Cyclohexane	110-82-7	9.25	9.24	to	9.26
2,2,4-Trimethylpentane	540-84-1	12.34	12.33	to	12.35
Total identified saturates		58.63	58.58	to	58.67
Thiophene	110-02-1	0.0030	0.0029	to	0.0031
3-Methylthiophene	616-44-4	0.0036	0.0035	to	0.0037
Benzo[<i>b</i>]thiophene	95-15-8	0.0070	0.0069	to	0.0071
Water	7732-18-5	0.009	0.008	to	0.010
Total oxygen from identified organic oxygenates		2.01	1.91	to	2.02

Figure 1. Chromatogram of reformulated gasoline base. Conditions: 100 m methylpolysiloxane column; injector temperature 200 °C; split ratio 200:1; initial temperature 35 °C, hold 10 min, programming rate 4 °C per min to 200 °C, final hold 10 min; detector temperature 280 °C. Except for *m*-xylene and *p*-xylene, the components unresolved by the conditions used to obtain the chromatogram in Figure 1 may be separated using the following: 30 m (6 % cyanopropyl) methylpolysiloxane column; injector temperature 200 °C; split ratio 200:1 initial temperature 30 °C, initial hold 5 min, programming rate 25 °C per min to 200 °C, final hold 0.2 min; detector temperature 280 °C.
