Standard Reference Material[®] 2219

Miniaturized Super-High-Energy Charpy V-Notch KLST Specimens

(Self-Verification)

Lot No. SH-36

This Standard Reference Material (SRM) is intended for the verification of maximum force and absorbed energy values measured at room temperature using a small-scale Charpy impact machine in accordance with the current ASTM Standard E2248 [1] or the current ISO Standard 14556 [2]. A unit of SRM 2219 consists of a set of three KLST-type miniaturized Charpy specimens needed to perform a single verification. SRM 2219 can be used to verify the absorbed energy scale of a small-scale impact machine at the super-high-energy level (approximately 10 J).

Material Description: SRM 2219 is made from T200 maraging steel. Each specimen has a code identifying the energy level (SH) and an identification number (up to three digits).

SRM Certification Procedure: Specimens taken from SRM 2219 were certified for both maximum force (F_m) and absorbed energy (KV) by means of an international interlaboratory comparison (round-robin) coordinated by the NIST Applied Chemicals and Materials Division [3]. The round-robin results were statistically evaluated in collaboration with the NIST Statistical Engineering Division to assure consistency among laboratories and establish certified values. A NIST certified value is a value for which NIST has the highest confidence in its accuracy, in that all known or suspected sources of bias have been investigated or taken into account [4]. The measurands are absorbed energy as measured by the NIST Charpy reference machines, and maximum force as established from the interlaboratory comparison. Traceability is to the SI units joule (absorbed energy) and kilonewton (force). The certified values for the SRM 2219 specimens are given in Table 1.

Table 1. Certified Values and Expanded Uncertainties for SRM 2219^(a)

Room temperature (21 °C ± 1 °C)			
Absorbed Energy (J)	Expanded Uncertainty (J)	Maximum Force (kN)	Expanded Uncertainty (kN)
10.03	0.17	1.79	0.08

^(a) The uncertainties in the certified values are expressed as expanded uncertainties, $U = k u_c$, where u_c is the standard uncertainty. The coverage factor, $k = 2.306$, is determined from Student's t-distribution corresponding to 8 degrees of freedom and a 95 % confidence level [4,5].

Expiration of Certification: The certified values and uncertainties furnished in this certificate are valid indefinitely. The indirect verification result for the absorbed energy scale is valid for one year from the date on which the SRM was tested. If a user's machine is moved or undergoes any major repairs or adjustments, the current verification will be invalidated, and the machine must be retested and verified (see "Instructions for Handling, Storage, and Use"). Currently, there are no requirements for the indirect verification of the force scale. However, it is recommended to verify the calibration of the instrumented striker of the small-scale Charpy machine every time the striker undergoes repairs or adjustment, or damage is suspected, and every time the impact machine is indirectly verified for absorbed energy.

Office of Reference Materials

Maintenance of SRM Certified Values: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification before the expiration of this certificate, NIST will notify the purchaser. Registration (see attached sheet or register online) will facilitate notification.

Overall direction and coordination of the technical measurements leading to verification of test specimens and machines are under the direction of the NIST Applied Chemicals and Materials Division, Boulder, CO.

Support aspects involved in the issuance of this SRM were coordinated through the NIST Office of Reference Materials.

INSTRUCTIONS FOR HANDLING, STORAGE, AND USE

Handling: The protective oil coating should be wiped from each specimen with a lint-free cloth just prior to testing.

Storage: The SRM is anticipated to have an indefinite shelf life under normal storage conditions ($20\text{ }^{\circ}\text{C} \pm 20\text{ }^{\circ}\text{C}$, $\leq 50\%$ relative humidity).

Use: Prior to verifying a small-scale Charpy V-Notch machine, the machine should be checked to assure compliance with the appropriate sections of the applicable ASTM or ISO standard. SRM 2219 is tested at $21\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$

When using SRM 2219, the user performs a self-service verification of the test machine. The data and specimens **are not** returned to NIST following the test. NIST provides **no** letter or certification sticker for the machine tested.

The energy level of the SRM appropriate for verifying the performance of a particular small-scale Charpy impact machine can be determined by considering the energy for the SRM, the maximum capacity of the machine, and the requirements of the applicable test method (ASTM or ISO).

For questions concerning the production or use of this SRM, please contact the NIST Charpy Program Coordinator: telephone (303) 497-3351; fax (303) 497-5939; or e-mail charpy@boulder.nist.gov.
